Disaster recovery and business continuity

0:00 / 9:51

The role of a security professional can ensure a company's data and assets are protected from threats, risks, and vulnerabilities. However, sometimes things don't go as planned. There are times when security incidents happen, and you'll need to be prepared to help your organization continue to function and minimize the loss of availability, safe customers or other businesses in the industry.

This reading will discuss the need to create business continuity and disaster recovery plans to minimize the impact of a security incident on an organization's business operations. And why recently consider the expansion of days to be lacked by the security team before business continuity and disaster recovery plans are implemented.

Identify and protect

Creating business continuity and disaster recovery plans are the first steps of whom part process that most security teams go through to help ensure the security of an organization.

First, the security team identified the assets that must be protected in the organization. Next, they determine what potential threats could negatively impact those assets. After the threats have been determined, the security team implements tools and processes to detect potential threats to assets. Lastly, don't or aggregate business function and processes to minimize the impact of security incidents. This is the identify and protect function of the NIST cybersecurity framework. The above helps minimize the impact of a security incident involving one of the organization's assets.

Business continuity plans

The impact of successful security attacks on an organization can be significant. Loss of confidence and customers are among the most damaging consequences of a security incident. A business continuity plan is a written document that outlines the procedures to sustain business operations during and after a significant disruption. It is created alongside cyberattack recovery plan to minimize the damage of a successful security attack. Here are four essential steps for business continuity plans:

- **Conduct a business impact analysis.** The business impact analysis focuses on the possible effects or disruption of business functions can have on an organization.
- **Identify, document, and implement steps to recover critical business functions and processes.** This step helps ensure that the security team has the information they need to respond to a security event.
- **Organize a business continuity team.** Once the team is established, they will come together to help implement the business continuity plan in its entirety. The members of this team are typically from the cybersecurity, IT, HR, communications, and operations departments.
- **Conduct testing for the business continuity team.** The team considers different risk scenarios and prepares for security threats during these testing exercises.

Disaster recovery plan

A **disaster recovery plan** (how an organization's security team handles the steps needed to minimize the impact of a security incident on business operations. Disaster recovery plans are created alongside business continuity plans. Following a data breach, it also helps the security team minimize the security threat. A disaster recovery plan is typically created during also a business continuity plan. Steps to create a disaster recovery plan should include:

- Implementing recovery strategies to restore software
- Implementing recovery strategies to restore hardware/data/security
- Identifying applications and data that might be impacted after a security incident has taken place

Key takeaways

Disaster recovery and business continuity plans are important for an organization's security posture. It's essential to identify, protect, and implement processes and systems that help the organization business operations moving forward in case a cloud incident does occur.
