1. On a major cloud platform, what two types of central services are typically used to create a a single view for unified observability? — 1 / 1 point

- ○ File storage and package management services.
- ◉ A centralized monitoring service and a centralized logging service.
- ○ Data integration and workflow orchestration services.
- ○ Database and data warehousing services.

Correct
Correct! Cloud platforms provide dedicated services for collecting metrics and logs from all other services to enable unified observability.

\- -

2. Why is a "workflow succeeded" status an insufficient signal for determining if a batch data pipeline is truly "healthy"? — 1 / 1 point

- ○ Because the orchestrator might have incorrectly reported a success.
- ○ This message only refers to the orchestration tasks, not the underlying compute resources.
- ○ The message only means the workflow definition was valid, not that the jobs were triggered.
- ◉ The job could have run much longer than usual or processed zero records, both of which are silent failures.

Correct
Correct! A healthy pipeline runs on time and processes the correct amount of data. A simple "success" status does not capture performance or data quality issues.

3. What is the primary benefit of writing logs in a structured, key-value format instead of as plain text strings? — 1 / 1 point

- ○ Plain text strings cannot be viewed in modern logging tools.
- ○ Structured logs automatically create alerting policies.
- ◉ It makes logs easy to filter and search with precise criteria, which drastically accelerates debugging.
- ○ Structured logs use less disk space and are cheaper to store.

Correct
Correct! Structuring logs transforms them from simple text into a queryable dataset, allowing you to instantly filter for the exact information you need.

\- -

4. What is the key difference between a reactive and a proactive monitoring strategy? — 1 / 1 point

- ◉ A reactive strategy involves manually checking dashboards for problems, while a proactive strategy uses automatic alerts to notify the team of issues.
- ○ A reactive strategy uses logging, while a proactive strategy uses metrics.
- ○ A reactive strategy fixes bugs before they happen.
- ○ A reactive strategy only uses default metrics, while a proactive one uses custom metrics.

Correct
Correct! Instead of relying on a human to find problems, a proactive strategy configures the system to automatically send notifications the moment an issue occurs.
