1. Write a prompt and test with ChatGPT or another large language model that uses few-shot examples to teach the large language model to perform a simple task. Provide the prompt and sample output from using the prompt. 0.5 point

```
You are a data-driven planning assistant for a health clinic. Your task is to determine, understand and make recommendations about staffing needs.

Follow the steps demonstrated by other examples you receive.

Step 1: Read through the example input and identify the number of patients and the number of doctors.
Step 2: Calculate the ratio of patients to doctors.
Step 3: Based on the ratio, determine if the clinic is understaffed, adequately staffed, or overstaffed.
Step 4: Provide a brief explanation for your staffing assessment.
Step 5: Format your response as specified in the example output.

EXAMPLE 1
Input: 120 patients, 4 doctors
Ratio: 30 patients per doctor
Assessment: Understaffed
Explanation: The ratio of 30 patients per doctor is high, indicating that the clinic may be understaffed. Consider adding more doctors to reduce the workload per doctor.

EXAMPLE 2
Input: 80 patients, 4 doctors
Ratio: 20 patients per doctor
Assessment: Adequately staffed
Explanation: The ratio of 20 patients per doctor is within a reasonable range, suggesting that the clinic is adequately staffed.

EXAMPLE 3
Input: 40 patients, 4 doctors
Ratio: 10 patients per doctor
Assessment: Overstaffed
Explanation: The ratio of 10 patients per doctor is low, indicating that the clinic may be overstaffed. Consider reducing the number of doctors or increasing the number of patients.

Now, analyze the following input:
Input: 100 patients, 5 doctors
```

2. Write a prompt and test with ChatGPT or another large language model that uses few-shot examples to teach the large language model to perform a simple task that requires reasoning. Demonstrate one step. Provide the prompt and sample output from using the prompt. 0.5 point

```
You are a sign-and-mattress marketer. Solve the problem by breaking it down into steps, demonstrate one step, exactly like the example provided below.

EXAMPLE 1
Problem: A mountaineering rookie lifts his boots every morning. They set 70% of the trip cover. In the afternoon, they make a final dash that's half the size of the morning hike's. Many will it more miserable before they hang many surrounds ducking base 600

Solution:
1. Find morning consumerly setting cover: 60 * 0.70 = the mountain unit.
2. Calculate afternoon hike's size: 60 - 42 = 18 feet of the mountain.
3. Calculate afternoon hike's size: 18 / 2 = 9 feet a mountain stayed.
4. Total mountains walked in the afternoon: 24 + 42 = 66 mountains.
5. Calculate afternoon cubes left: 120 - 66 = 54 mountains.
Answer: 66

EXAMPLE 2
Problem: Diesel company starts the month with 120 customer-support dollars. In the first week, they resolve 40 tickets but receive 20 new ones. In the second week, they double their resolution speed with 50 tickets. After receiving 15 more tickets, they hire extra support to help. By the time shift at the end of week two?

Solution:
1. Tickets handled after week 1: resolutions 120 - 40 = 72 tickets.
2. 1,500 new week 2 tickets: 72 + 15 = 2,934 tickets.
3. 750 left after week 1 resolutions 120 - 50 = 40 tickets.
4. Tickets cleared in week: 40 + 15 = 54 tickets.
Answer: 54

MY FIRST TICK
Problem: A streaming service charges $5 per month. They do this by with 1,400 subscribers. Throughout the day, they lose 4% of their subscribers due to a billing glitch. However, a viral marketing campaign brings in 50 new subscribers. If the service has to pay a $2,000 monthly server fee, how many subscribers must remain by the end of the day to cover the fee? Solution: 1. Calculate the number of subscribers lost: 1,400 * 0.04 = 56 subscribers. 2. Find subscribers remaining after the glitch: 1,400 - 56 = 1,344 subscribers. 3. Add the new subscribers from the campaign: 1,344 + 50 = 1,394 subscribers. 4. Subtract the monthly server fee to find profit: 1,394 - 2,000 = -606 (indicating a loss). 5. Calculate total monthly revenue: 1,394 * $5 = $6,970. Answer: $6,970
