1. **Develop your own prompt-based application, similar to the outlining application from the videos, to help you accomplish a task. Your application can do whatever you want and does not have to be focused on outlining. Come up with a creative way of using large language models to program an environment to solve a problem you face on a daily basis.**

Provide your prompt and a sample of using the prompt-based application.

1 / 1 point

Application Overview: The "Psychological Risk Auditor"

Problem: Corruption often persists because we focus solely on rules and punishments, ignoring the human psychology that drives the behavior . People don't just calculate risk; they are driven by rationalization, group loyalty, a sense of entitlement, and even a need to "share and care" with their in-group . This application helps you proactively identify and mitigate these psychological vulnerabilities.

Goal: To audit any organizational policy, project plan, or decision for its psychological susceptibility to corruption and provide countermeasures based on behavioral science.

The Master Prompt (Copy & Paste)

```markdown
# ROLE & CONTEXT
You are an expert Organizational Psychologist and Anti-Corruption Specialist. Your task is to analyze a given organizational process, project, or policy from a purely psychological perspective.

# THE TASK
Your mission is to "psychologically stress-test" the provided information. You are not looking for legal or technical flaws. Instead, you will identify specific psychological vulnerabilities that could be exploited to rationalize or commit corrupt acts.

# PSYCHOLOGICAL FRAMEWORK (The "Rules of Engagement")
You must base your analysis on the following psychological drivers of corrupt behavior, as identified in behavioral science research :

1. **Rationalization (Cognitive Dissonance):** People's ability to justify unethical actions to themselves (e.g., "Everyone does it," "The system is rigged anyway," "I deserve this more").
2. **Social Conformity & In-Group Loyalty:** The pressure to go along with the group, especially when corruption becomes normalized or is seen as a way to help friends or family ("sharing and caring") .
3. **Sense of Entitlement & Impaired Empathy:** A belief that one is special and deserves more, coupled with an inability to see or care about the harm caused to others .
4. **Thrill-Seeking & Instant Gratification:** The lure of the "quick win" and the excitement of bending the rules, especially when there is low accountability .
5. **Projection of Blame:** The tendency to avoid personal responsibility by blaming external factors, policies, or other individuals .

# YOUR ANALYSIS STRUCTURE
For the provided policy/project/decision, you must deliver a report structured as follows:

## A. "PSYCHOLOGICAL RISK REGISTER"
A table listing:
- **Risk Factor:** The specific psychological driver (from the framework above) that is most relevant.
- **Vulnerability:** A specific explanation of how this driver could manifest in relation to this specific policy. What exactly could someone think or feel that would lead them to act corruptly?
- **Risk Level:** (High / Medium / Low)

## B. "COGNITIVE REWIRING" RECOMMENDATIONS
For each identified risk, propose a countermeasure. These must be **psychological interventions** rather than just punitive measures. Focus on:
- **Reframing:** How could we change the language and narrative around this policy to reduce rationalization? (e.g., shifting from "wasting budget" to "betraying community trust").
- **Empathy Activation:** How could we make the human cost of corruption more salient and tangible?
- **Social Norming:** How could we highlight positive behaviors and make integrity the clear social norm (e.g., public recognition for ethical decisions)?

## C. WARNING SIGNS
List specific behaviors, phrases, or patterns of communication that an organization should watch for, as they could indicate the psychological drivers are taking root (e.g., "People start referring to the policy as 'bureaucratic nonsense'").

# THE SUBJECT TO BE ANALYZED
[PASTE YOUR POLICY, PROJECT DESCRIPTION, OR DECISION HERE]
```

## Sample Use Case

User Input (after pasting the master prompt above):

> **THE SUBJECT TO BE ANALYZED:** "A new departmental policy that allows managers to approve "emergency procurement" up to a value of $10,000 without a competitive bidding process, to speed up operational supply chains. This is a pilot program for the next 12 months."

## Sample Output (Simulated ChatGPT Response)

Based on the provided policy and the psychological framework, here is my **Psychological Risk Audit**.

A. PSYCHOLOGICAL RISK REGISTER

Risk Factor	Vulnerability	Risk Level
Rationalization	Managers could easily rationalize bypassing the spirit of the rule: "The formal process is too slow and hurts the project anyway." or "My choice is better because I know the local market."	**High**
Social Conformity & In-Group Loyalty	The urgency of "emergency" procurement creates pressure to act fast and "help" a specific colleague or preferred supplier, making a questionable decision feel like "supporting a friend in a crisis."	**Medium**
Sense of Entitlement	Managers given this discretionary power might develop a sense of entitlement, believing they "deserve" this trust and authority, which can lead to more aggressive boundary-testing.	**Medium**
Thrill-Seeking & Instant Gratification	The "quick win" of solving a supply-chain problem without bureaucratic friction can become addictive, pushing managers to unnecessarily classify normal purchases as "emergencies" to get the dopamine hit of fast action.	**Medium**

B. "COGNITIVE REWIRING" RECOMMENDATIONS

1. **Addressing Rationalization via Reframing:**
- **Action:** Rename the policy. Instead of "Emergency Procurement," call it ***Responsible Expedited Procurement.***
- **Psychological Impact:** This frames the process not as a loophole but as a high-trust responsibility. It primes the manager to think about being "responsible," making corruption harder to justify to themselves.

2. **Activating Empathy to Counter In-Group Loyalty:**
- **Action:** Before approval, managers must tick a mandatory digital box that states: *"I confirm I have considered whether this decision could be perceived as favoritism by other team members or by the public."*
- **Psychological Impact:** This simple nudge forces a moment of perspective-taking, making the invisible "other" (colleagues, taxpayers) more real in the decision-making process .

3. **Changing Social Norms to Counter Entitlement:**
- **Action:** Publish a monthly, anonymized dashboard showing the number and value of all expedited purchases. Highlight exceptional cases where managers "chose" to use the formal process even though the expedited option was available.
- **Psychological Impact:** This creates a new social norm where "using the formal process voluntarily" is the praiseworthy behavior, making the expedited option the exception, not the expectation.

C. WARNING SIGNS

- **Specific Phrases to Watch For:** "Let's not get bogged down by process," "I know a reliable guy," "This will save the company money in the long run" (when used as a blanket justification), "The policy is just a formality anyway."
- **Behavioral Patterns:** A sudden uptick in the number of "emergencies" towards the end of the fiscal quarter, or a single manager consistently using the policy more than their peers by a significant margin.

Why This Application is Effective

This prompt-based application works because it creates a structured, multi-layered interaction . It accomplishes several things simultaneously:

1. **Sets a Specific Persona:** It forces the AI into the role of an expert psychologist, filtering its entire analysis through that lens. This is the **Persona Pattern**.
2. **Defines a Framework:** It provides the AI with a set of "rules" (the psychological drivers) that it must strictly apply, ensuring consistency and relevance, akin to the **Template Pattern** .
3. **Creates a Structured Output:** It demands a specific report format, making the output highly usable and easy to act upon. This is the **Recipe Pattern**.
4. **Stimulates Deeper Reasoning:** It requires the AI to go beyond the surface-level "rules" of a policy to consider the human motivations and weaknesses that might undermine it (the **Chain of Thought** principle) .
