1. What is the primary function of Dataplex in Cymbal E-commerce's data lakehouse?

1 / 1 point

- ☐ To automatically de-identify all incoming sensitive data streams.
- ☒ To act as a universal catalog for all data assets across BigQuery, Cloud Storage, and BigLake.
- ☐ To enforce row-level security on Cloud Storage buckets.
- ☐ To execute machine learning models directly on raw data.

☒ Correct

Correct! The lesson explicitly states that for the fictional company Cymbal E-commerce, "Dataplex acts as a universal catalog for all their data assets". This centralized catalog is critical for data discovery and management.

2. To comply with data privacy regulations, Cymbal E-commerce uses Sensitive Data Protection to manage PII. What are the three core functions of this process?

1 / 1 point

- ☐ Ingestion, Transformation, and Loading.
- ☐ Authentication, Authorization, and Accounting.
- ☐ Discovery, Classification, and Protection.
- ☐ Auditing, Alerting, and Reporting.

☒ Correct

Correct! The lesson material states, "The process includes the following functions: Discovery, Classification, and Protection". This is the explicit methodology used to find and secure sensitive information.

3. A marketing analyst at Cymbal E-commerce needs access to a customer table but should not be able to view the customers' contact information. Which security control is most effective for protecting this Personally Identifiable Information (PII)?

1 / 1 point

- ☐ IAM bucket-level permissions.
- ☐ Row-level security.
- ☐ Dynamic data masking.
- ☐ Column-level security.

☒ Correct

Correct! The lesson defines column-level security as the control that "restricts access to specific columns in a table," making it the perfect tool for protecting PII like contact information while allowing access to other data.

4. When setting up a Sensitive Data Protection job to de-identify a table for the analytics team, an engineer wants to replace email addresses with a non-reversible token that still allows for counting unique customers. Which transformation should they apply?

1 / 1 point

- ☒ Tokenization with a cryptographic hash, to maintain referential integrity.
- ☐ Anonymization, to remove the email column entirely.
- ☐ Masking, to show only the first part of the email address.
- ☐ Redaction, to replace emails with a placeholder like [REDACTED_EMAIL].

☒ Correct

Correct! The lesson explains that tokenization with a cryptographic hash is used for the email column because it "maintains referential integrity". This means the same email is always replaced by the same token, allowing for accurate unique counts without exposing the PII.

5. What is the primary advantage of using BigQuery ML for a task like predicting customer churn at Cymbal E-commerce?

1 / 1 point

- ☐ It requires moving data to a separate, specialized machine learning environment for training.
- ☐ It automatically cleans and preprocesses all raw data from the bronze zone without user input.
- ☐ It is only capable of building deep learning models using TensorFlow.
- ☐ It allows data analysts to build and deploy machine learning models using simple SQL queries.

☒ Correct

Correct! The lesson highlights that BigQuery ML's power is that it "allows data analysts and data scientists to build and deploy machine learning models using simple SQL queries," making ML more accessible.

6. Which SQL statement in BigQuery ML is used to begin the process of training a new model?

1 / 1 point

- ☒ CREATE MODEL.
- ☐ SELECT MODEL.
- ☐ ML_PREDICT.
- ☐ ML_EVALUATE.

☒ Correct

Correct! The lesson clearly shows that analysts "train a model with a single CREATE MODEL statement in SQL." This statement defines the model type, options, and training data.

7. While BigQuery ML is excellent for many use cases, Cymbal's data scientists need to build a complex, custom product recommendation engine. Which Google Cloud service provides an end-to-end platform for this advanced task and integrates seamlessly with BigQuery?

1 / 1 point

- ☐ Vertex AI.
- ☐ Looker.
- ☐ Sensitive Data Protection.
- ☐ Dataplex.

☒ Correct

Correct! The lesson specifies that for more complex situations requiring a comprehensive ML platform, "you can use Vertex AI. Vertex AI is the Google Cloud end-to-end platform for building, deploying, and managing ML models."

8. In the Medallion architecture, which zone contains the final, highly-refined, and aggregated data optimized for analytics and reporting?

1 / 1 point

- ☐ The Bronze Zone.
- ☐ The Raw Zone.
- ☐ The Gold Zone.
- ☐ The Silver Zone.

☒ Correct

Correct! The lesson describes the Gold Zone as the "final, highly-refined layer" where data is "aggregated and optimized for analytics and reporting" and serves as the "single source of truth for key business metrics".
