1 / 1 point

1. A developer is building an Android application and needs to provide users with up-to-date information about local events and points of interest. Which Gemini API feature should they implement for managing real-time, external information into the application? Note the best answer.

- Maps integration
- Multimodal Analysis
- Google Search grounding
- Text Generation

Nice work

Correct. Google Search grounding allows the model to access and use information from Google Search, providing the most current data available.

1 / 1 point

2. A project manager wants to quickly test several different AI-powered features ideas for a new product before committing development resources. Which AI platform's key value proposition is its wide range of APIs, enabling rapid prototyping and experimentation with various models?

- Gemini API's detailed performance benchmarks for various foundation models.
- Kubernetes-orchestrated application tools based on a high-level project description.
- Vertex AI's model-as-a-service offerings, which abstract away infrastructure management.
- Firebase Studio's integration of AI models into existing deployment pipelines.

Nice work

Correct. Vertex AI Studio allows users to experiment with prompts and features through a user interface, making it possible to validate ideas quickly before development.

1 / 1 point

3. A developer is setting up a new project in Google AI Studio and needs to make a API key for their application. As a best practice, which of the following ways of storing and accessing the key is the most secure?

- Creating an API key for all of the project's services and environments.
- Committing the API key to a private code repository for version control.
- Storing the API key in a project management tool for easy access.
- Applying specific restrictions to the key to limit its scope of use.

Nice work

Correct. Limiting a key's permissions, such as by IP address or API service, is a critical security measure that follows the principle of least privilege.

1 / 1 point

4. A developer is creating a workshop on AI tools for an e-commerce chatbot. The goal is for the chatbot to identify a product from an image a user uploads and then recommend it. Which combination of features would be required to build a prototype that fulfills these? Note the best answer.

- Image analysis and function calling
- Setup providing user temperature
- Vision optimizing and Google Search grounding
- Image analysis and text generation

Nice work

Correct. Image analysis is needed to understand the content of the user's uploaded image, and text generation is needed to create the product description.

1 / 1 point

5. A developer is preparing to launch a new feature and has been testing it extensively using a API key from Google AI Studio. They are now ready to deploy the feature to a production environment. Which approach offers a simple, built-in, and recommended way to manage this transition from a development to a production context? Select the best answer.

- Use the existing API key in both environments to streamline the deployment process.
- Create a new API key specifically configured for the production environment's needs.
- Migrate the existing API key to the production project's associated billing and usage limits.
- Store the existing API key in a secure configuration variable key between environments.

Nice work

Correct. A dedicated API key for production ensures that environments are isolated, allows for precise permission settings, and enables independent monitoring and control.
