1. Sarah is a data scientist at a mid-sized company. She wants to implement a model that can handle multiple NLP tasks with minimal labeled data. Which approach should she consider using?

1 / 1 point

- ☐ Developing a rule-based system
- ☐ Using a small dataset to train a new model from scratch
- ☒ Using a foundation model with tuning
- ☐ Training a separate model for each task

Nice work

Foundation models can be tuned with minimal labeled data to perform various NLP tasks.

2. Which of the following best describes the Natural Language Understanding (NLU) process in Natural Language Processing (NLP)?

1 / 1 point

- ☒ Translating unstructured text into structured data
- ☐ Analyzing the grammatical structure of sentences
- ☐ Generating human-like responses to text inputs
- ☐ Converting structured data into unstructured text

Nice work

This correctly describes NLU, which involves converting unstructured text into structured data.

3. A company wants to implement a system to predict customer behavior patterns using past data. Which AI approach should they focus on?

1 / 1 point

- ☐ Expert systems
- ☐ Rule-based AI
- ☐ Generative AI
- ☒ Machine learning

Nice work

Machine learning is ideal for this scenario as it excels at identifying patterns in data and making predictions.

4. How do discriminative and generative models fundamentally differ in how they learn from data?

1 / 1 point

- ☒ Discriminative models focus on decision boundaries, while generative models model data distributions.
- ☐ Discriminative models handle unsupervised learning, while generative models require labeled data.
- ☐ Discriminative models copy data patterns, while generative models ignore structure.
- ☐ Discriminative models generate new outputs, while generative models narrow down categories.

Nice work

Discriminative models learn boundaries between classes, while generative models learn how data is distributed.

5. Emma must implement a Natural Language Processing system to convert spoken language into structured data. Which process within NLP primarily translates spoken or written text into a structured format?

1 / 1 point

- ☐ Natural Language Generation (NLG)
- ☒ Natural Language Understanding (NLU)
- ☐ Tokenization
- ☐ Named Entity Recognition

Nice work

NLU is responsible for converting unstructured text into a structured format that computers can understand.
