Prototyping and Strategic Evaluation of Generative AI +15 XP

2023-08-14

1. How does in-context learning differ from traditional machine learning approaches regarding model training and task adaptation?

1 / 1 point

☐ In-context learning is constrained by the model's initial training data.

☐ In-context learning adapts to new tasks using small examples provided during inference.

☐ In-context learning requires fine-tuning the model on specific datasets.

☐ In-context learning involves adjusting the model's weights based on error gradients.

☒ Nice work

In-context learning uses examples at inference time to adapt to new tasks without additional training.
2. Imagine a situation where a company wants to use an LLM to translate customer reviews into multiple languages without prior examples. Which prompt engineering method is most suitable for this task?

1 / 1 point

☐ Chain-of-thought prompting

☐ Zero-shot prompting

☐ One-shot prompting

☐ Few-shot prompting

☒ Nice work

Zero-shot prompting allows the LLM to perform tasks like translation without prior specific examples.
3. What is the primary role of the pipe operator in LangChain's LCEL Chaining Method?

1 / 1 point

☒ To connect components in a readable and flexible manner

☐ To create complex workflows by replacing LangGraph

☐ To handle type coercion manually

☐ To execute components in parallel without input

☒ Nice work

The pipe operator in LCEL connects components, ensuring a readable and flexible data flow.
4. Imagine you want to build a reusable AI application pattern using LangChain. What is the benefit of using LCEL over traditional LLMChain approaches?

1 / 1 point

☐ LCEL requires more complex syntax to define workflows.

☐ LCEL eliminates the need for any templates.

☐ LCEL restricts the use of parallel execution.

☒ LCEL provides clearer visualization of data flow.

☒ Nice work

LCEL offers clearer visualization of data flow, enhancing workflow readability and flexibility.
5. What is the primary advantage of using PromptTemplate over hardcoded strings when working with LLMs in LangChain?

1 / 1 point

☐ PromptTemplate restricts the LLM to only respond with specific formats.

☐ PromptTemplate caches responses to avoid repeated API calls.

☒ PromptTemplate enables dynamic insertion of variables into standardized prompt structures.

☐ PromptTemplate automatically optimizes token usage to reduce costs.

☒ Nice work

PromptTemplate allows variables to be inserted into reusable prompt structures, making prompts dynamic and consistent.
