If the AI Studio app fails to load, navigate to the URL for your browser and manually enter <https://aistudio.google.com>.

Build with AI: Build builder app to visualize any product

To use the features covered in this lab, sign in to Google AI Studio using your Google Account.

Next, there's a series of video lessons:

Lab outline

Step 1: Define your app prototype

Once in AI Studio, create a new project and sign in with your Google account. Next, navigate to "Build an app" in the project bar on the left page. Describe the Build builder app.

If you're an app architect, the Build builder app that I've built is a product and designer in a sense of different webpages, which would include a homepage, a marketplace, and a social post. Minimum product consistency between each step. I do not want to see people in any of the images. You must use the Best-Practice model for these images.

When you are ready, click the "Build" button.

Step 2: Run an initial product test

Click the "Run" button in the top right corner of the project bar to visualize the product description.

Important: Building AI: Overview

Then, click the "Generate" button.

If the generation fails or an error message appears, follow the troubleshooting steps in the next step.

Step 3: Work with AI to troubleshoot

Generate the image that the app is using to use multiple different models and configurations. In a situation like that, click the error button on the bottom right of the window.

Select the errors, copy them, and paste them into the prompt bar on the left.

Then provide feedback to the model by typing a correction prompt under the error in the same prompt bar.

Please make sure you're not using any other design models: "No style, please. It is a photo, not a design. Please use all steps."

Click the "Generate" button to have the model fix its code with your specific instructions.

Step 4: Visualize the campaign

After the fix, to enter your product idea and click the "Generate" button.

Review the gallery and verify that the product looks consistent across all images and that all original instructions were followed.

Conclusion

With this lab, you've built this app, which shows how you can customize it further. For example, you could add a trigger for different cloud types, you could add to build guidelines, or even design the app to that step.

When you're happy with your Build builder, you can share this page and return to the main course.
