

Automate Cybersecurity Tasks with Python ×

Module 1 ▼ Introduction to Python

Module 2 ▼ Write effective Python code

Module 3 ▼ Work with strings and lists

Module 4 ▲ Python in practice

Python for automation

- ✓ Welcome to module 4
Video • 1 min
- ✓ Automate cybersecurity tasks with Python
Video • 3 min
- ✓ Automating Tasks in CI/CD
Reading • 10 min
- **Essential Python components for automation**
Reading • 8 min
- Clancy: Continual learning and Python
Video • 2 min
- Test your knowledge: Python and automation
Practice Assignment • 8 min

Work with files in Python

Essential Python components for automation

 0:44 / 6:01
 
1x

Throughout this course, you explored coding in Python. You've focused on variables, conditional statements, iterative statements, functions, and a variety of ways to work with strings and lists. In this reading, you will explore why these are all essential components when automating tasks through Python, and you'll be introduced to another necessary component: working with files.

Automating tasks in Python

Automation is the use of technology to reduce human and manual effort to perform common and repetitive tasks. As a security analyst, you will primarily use Python to automate tasks.

You have encountered multiple examples of how to use Python for automation in this course, including investigating logins, managing access, and updating devices.

Automating cybersecurity-related tasks requires understanding the following Python components that you've worked with in this course:

Variables

A **variable** is a container that stores data. Variables are essential for automation. Without them, you would have to individually rewrite values for each action you took in Python.
