1. A security and protection that an employee has installed on app on their work device without getting permission from the help desk. The log shows that potentially malicious code might have been executed on the host. Which of these security events describes security analyst escalation suspicion? 1 / 1 point

- The log indicating malicious code might have been executed on the host should be escalated.
- The employee installing an app without permission should be escalated.
- Neither event should be escalated.
- Both event should be escalated.

  ✓ Nice work

  Both events should be escalated to a supervisor. There are no issues that are too small or too big. It's always best to err on the side of caution and report events to the appropriate team members.

2. Which are types of data and assets that stakeholders are most interested in protecting? Select two answers. 1 / 1 point

- Customers' usernames and passwords

  ✓ Nice work

  Sensitive financial data and customer's usernames and passwords are examples of data and assets that stakeholders are most interested in protecting.

- Social media presence
- Sensitive financial data

  ✓ Nice work

  Sensitive financial data and customers' usernames and passwords are examples of data and assets that stakeholders are most interested in protecting.
