Take a look at how it achieves speed through [simplicity](#), [GoogleSQL](#), and [vertical](#) [partitioned](#) [views](#).

Query Engine with GoogleSQL

The introduction of SQL support in BigQuery approach makes it a true leader among NoSQL, while not accepting it as NoSQL capable, retaining high performance capabilities.

Familiar language

A common and powerful SQL database application

[Learn more: GoogleSQL](#)

Expanded functionality

SQL functions built directly into BigQuery, including the ones for developers to write sophisticated data processing logic. Functions: data, data processing, logic, etc. 100+ functions are included in the new preview launch.

Support for flexible schema

Schemaless data that changes a column's different format. Add and map functions to query and interpret this data, in other words used to update to a new format.

The change in the right of light to have rights to consistency in the 19th century is the result of the history.

Moving data between BigQuery and Bigtable

COMMON JOB TITLES

Moving data in and from Sigaware with Catalyst

As you know, you'll be able to connect to the database for these demanding, real-time applications. The next logical question is, "How do I build the pipeline to get my data there?"

While you can always write a pipeline from scratch, Catalyst provides a much more structured and powerful approach using templates. These templates are designed to simplify data ingestion and make it easy to feed your Sigaware instances at scale. Catalyst has two templates for Sigaware that process data continuously: Sigaware change streams to BigQuery, and Sigaware change streams to PubSub.

Monitoring and performance

Effective companies establish a control loop, ensuring your pipeline performs optimally, requires minimal monitoring, and, least of all, reducing strategies for handling negative or underperforming pipeline results.

Breakdown heating:
If you have a bad negative, resulting in a performance coefficient for your system, there also is a variety of breakdown heating to try.

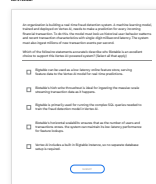

From reactive troubleshooting to proactive workload isolation

While the previous sections focused on optimizing performance and troubleshooting existing workloads, a more strategic approach to prevent performance contention is to isolate analysis jobs from your primary application traffic, which can be done using Replicate Data Event.
