Continuous processing with Datalore

Continuous processing with Datalore allows you to process large datasets in real time, without the need to store them in a data warehouse or data lake. This is achieved by using Datalore's **Continuous Processing** feature, which allows you to process data as it arrives, without the need to store it first.

Key benefits of Continuous Processing:

- Real-time processing:** Data is processed as it arrives, without the need to store it first.
- Scalability:** Datalore can process large datasets in real time, without the need to store them in a data warehouse or data lake.
- Flexibility:** You can process data in a variety of ways, including as it arrives, or as it is stored in a data warehouse or data lake.

How Continuous Processing works:

Continuous Processing works by using Datalore's **Continuous Processing** feature, which allows you to process data as it arrives, without the need to store it first. This is achieved by using Datalore's **Continuous Processing** feature, which allows you to process data as it arrives, without the need to store it first.

Getting started with Continuous Processing:

To get started with Continuous Processing, you need to have a Datalore account and a dataset to process. Once you have these, you can use the **Continuous Processing** feature to process your data in real time.

Advanced topics:

- Continuous Processing with Datalore:** This section covers the basics of Continuous Processing with Datalore, including how to set up a Continuous Processing job and how to monitor its progress.
- Continuous Processing with Datalore:** This section covers the basics of Continuous Processing with Datalore, including how to set up a Continuous Processing job and how to monitor its progress.
