

Your grade: 100%

You scored 100% - You Answered 100% - To pass you need at least 80%. We keep your highest score.

Total items: 18

1. In Google Cloud (GCP), what type of VMs are used?

1 / 1 point

- ☐ Regional
- ☐ Zonal
- ☐ Global
- ☐ Multi-regional

Correct

That's correct. VMs are used in Google Cloud. This is beneficial because your VMs can be distributed across multiple regions without complicating your network topology.

2. What is the main reason customers choose Preemptible or Spot VMs?

1 / 1 point

- ☐ To reduce cost
- ☐ To improve performance
- ☐ To use custom machine types
- ☐ To reduce cost on premium operating systems

Correct

That's correct! The per-hour price of Preemptible and Spot VMs incorporates a substantial discount.

3. For which of these interconnect options is a Service Level Agreement available?

1 / 1 point

- ☐ Carrier Peering
- ☐ Standard Network Tier
- ☐ Dedicated Interconnect
- ☐ Direct Peering

Correct

Correct! Dedicated Interconnect is correct because Google provides an SLA for this managed service, guaranteeing performance.

4. How does global Cloud Load Balancing allow you to balance HTTP-based traffic?

1 / 1 point

- ☐ Across multiple physical machines in a single data center
- ☐ Across multiple Google Cloud services
- ☐ Across multiple Compute Engine regions
- ☐ Across multiple virtual machine instances in a single Compute Engine region

Correct

Correct! With global Cloud Load Balancing, your application presents a single front-end to the world.

5. What of the following describes a Virtual Private Cloud (VPC)?

1 / 1 point

- ☐ A service that routes traffic through a Google Cloud Private IP (GPI)
- ☐ A fully distributed, software-defined, managed service for traffic distribution
- ☐ An option that allows one or more direct, private connections to Google
- ☐ A secure, hybrid, private cloud computing network hosted within a public cloud

Correct

Correct!
