

BackUnderstanding Agentic AI Concepts

Your grade: 100%

Score 100%

1. A developer is building an AI agent that interacts with a user over multiple steps. The agent begins making sequential decisions throughout the process, choosing actions at various points. What is the most effective way to do this best?

Use sequential decision-making and feedback loops to make iterative improvements to the agent's performance.

Include previous user and assistant messages in the prompt for each new iteration.

Increase the complexity of the model's responses to improve adaptability across iterations.

None work

Correct answer: Use sequential decision-making and feedback loops to make iterative improvements to the agent's performance.

2. A developer uses a single prompt to ask an LLM to:

generate a list of ideas

write documentation

and create test cases

The prompt is successful and generates a series of three tasks.

Which approach would most effectively improve the quality of the result?

Context Management

Regeneration Management

Prompt Chaining

Output Processing

None work

Correct answer: Prompt Chaining

3. Why are the results of AI or test cells typically represented as "user" messages to an AI agent system?

To provide the model with the result of a user report so it can decide the next action

To allow the model to store results internally for future use

To have the user's interaction considered by the model as part of the ongoing interaction

None work

Correct answer: To have the user's interaction considered by the model as part of the ongoing interaction

4. A developer is building an AI agent that needs to trigger actions like API calls and database updates. However, the model's responses are slow and unreliable, leading to delays in the system's overall performance. What is the most effective way to address this issue?

Ask the model to generate more detailed explanations so the system has more context to interpret

Consider the model to produce responses in a consistent, structured format that can be passed into actions

Allow the model to generate less than responses and rely on heuristics to extract the intended action

Increase the number of iterations in the prompt so the model has more time to generate a response

None work

Correct answer: Consider the model to produce responses in a consistent, structured format that can be passed into actions

5. In a multi-message AI interaction, which message type is primarily used to define the model's behavior and capabilities before it processes user input?

User messages, as they contain the task or question

System messages, as they establish instructions that guide how the model responds throughout the interaction

All message types equally contribute to defining behavior

None work

Correct answer: System messages, as they establish instructions that guide how the model responds throughout the interaction
