Knowledge check: Making Gemini work for you
Practice Assignment • 15 min

Due Aug 19, 11:59 PM IST

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

Next item →

1. **A developer is building a high-volume social media monitoring tool. The tool needs to quickly classify thousands of comments per minute as positive, negative, or neutral. The cost per classification must be very low. Given these requirements for speed and cost-efficiency, which statement accurately describes the key difference between Gemini Pro and Flash? Select the best answer.** 1 / 1 point

   ○ Pro and Flash have identical capabilities, but Flash is only available in certain regions.
   ○ Pro is faster for short text inputs, while Flash is better for analyzing long documents.
   ○ Flash has more advanced multi-language capabilities, while Pro focuses mainly on English.
   ● Flash is optimized for high-speed and lower-cost tasks, while Pro is designed for complex reasoning.

   ✓ Nice work

   Correct! Gemini Flash is the ideal choice for high frequency, cost-sensitive tasks where speed is more important than deep analysis.

2. **A developer is building an application that generates legal document summaries. To ensure accuracy, they want to review the model's step-by-step reasoning process for each summary it creates. How should the developer structure their API call to get insights into the model's reasoning process? Select the best answer.** 1 / 1 point

   ○ By using a special API key that is designated for debugging and analysis
   ○ By sending a follow up request that asks the model to explain its previous answer
   ○ By adding a parameter that requests a higher quality output from the model
   ● By including a thinking configuration that specifies a thinking for the request

   ✓ Nice work

   Correct! The thinking configuration tells the API to return a thought summary, which shows the model's reasoning.

3. **A financial services company is developing an AI tool to analyze detailed market reports. The analysis must be extremely accurate to inform investment decisions. The company is willing to accept slightly longer wait times and higher costs to ensure the best possible quality. What is the most important trade-off the company is making in this scenario? Select the best answer.** 1 / 1 point

   ○ They are trading user interface simplicity for a wider range of model features.
   ● They are trading lower cost and latency for higher performance and output quality.
   ○ They are trading faster development time for a more complex application architecture.
   ○ They are trading lower API usage limits for better integration with other services.

   ✓ Nice work

   Correct! The company is prioritizing high-quality analysis (performance) over speed (latency) and expense (cost), which is a key trade-off in model selection.

4. **A hobbyist developer is creating a free mobile game. The game includes an AI character that generates fun, short, and creative greetings for players. The developer needs to keep API costs as low as possible and ensure the greetings appear instantly. Based on the need for speed and low cost, which model is the most appropriate selection for this use case? Select the best answer.** 1 / 1 point

   ○ Google AI Studio because it is the best platform for building games
   ○ A custom trained model because it would be tailored to the game's style
   ● The Gemini Flash model because it is designed for speed and cost-efficiency
   ○ The Gemini Pro model because it offers the most creative text generation

   ✓ Nice work

   Correct! The Flash model is perfect for applications that need fast responses and have a tight budget, like this mobile game.

5. **A team is using model thinking to continuously monitor and improve their AI's performance in a production application. They need to collect enough reasoning data to be useful, but they also have a strict monthly budget for API calls. What is the primary balance the team must manage when configuring the thinking for their monitoring system? Select the best answer.** 1 / 1 point

   ○ The balance between the physical location of the server and the speed of the response
   ● The balance between the depth of the reasoning insights received and the overall API costs
   ○ The balance between the model's creativity and its ability to follow instructions precisely
   ○ The balance between the number of developers on the team and the complexity of the code

   ✓ Nice work

   Correct! A higher thinking provides more detailed insights but increases the cost of each API call. The team must find the right balance for their needs and budget.
