Next Item
1. What Google Cloud feature would be ideal for use to automate a build in response to code being checked into your source code repository?
1 / 1 point
Build Engine
Build triggers
Cloud Scheduler
Cloudfiux functions.
How work
Build triggers is correct. Cloud Build triggers have been designed specifically to trigger a build automatically when changes are made to source code.
2. Which Google Cloud tools can be used to build a continuous integration pipeline?
1 / 1 point
Cloudbuild
Artifact Registry
Cloud Source Repositories.
All of these
How work
All of the options are correct. Source Repositories provides a private Git repository, Cloud Build builds containers, and Artifact Registry is a docker images repository that performs vulnerability analysis. All these components are typically used in a continuous integration pipeline where once commit, code is built and tested, and an images built and published to a registry.
