

Your grade: 100%

From score: 100% / 100% (100%) You have passed all 10 questions. You have passed all 10 questions.

Settings

1. Your Pod has been moved, and the original IP address that was assigned to the Pod is no longer available. What is the reason for this?

1/1 points

- ☐ The old Pod's address is blocked by a firewall.
- ☐ The new Pod's address is blocked by a firewall.
- ☐ The new Pod's address is blocked by a firewall.
- ☐ The new Pod's address is blocked by a firewall.
- ☐ The Pod IP range for the cluster is exhausted.

How work

This is a correct answer. In a Pod, the IP address is assigned to the Pod's network interface. If the Pod's IP address is exhausted, the Pod gets assigned a new IP address.

2. You have created your application and deployed it into a Pod. How can you ensure consistent network access to the Pod throughout its lifecycle?

1/1 points

- ☐ Register the Pod's IP address with your application's DNS server.
- ☐ Add a Kubernetes Service to the Pod's network to allow your application to connect.
- ☐ Deploy a Kubernetes Service with a selector that targets the application's Pods.
- ☐ Add a Pod's IP address to your application's DNS server.

How work

This is the correct answer. In a Pod, the IP address is assigned to the Pod's network interface. If the Pod's IP address is exhausted, the Pod gets assigned a new IP address.

3. During testing, you learned that the Google Cloud load balancer that should have been configured for your application. You checked the load balancer and verified that the application's IP address was in the Cloud's IP range. What is the reason for this?

1/1 points

- ☐ Defines your application's IP address, used for the service and to deploy the application.
- ☐ Defines your application's IP address in the IP range, used for the service and to deploy the application.
- ☐ Defines your application's IP address in the IP range, used for the service and to deploy the application.
- ☐ Defines your application's IP address in the IP range, used for the service and to deploy the application.
- ☐ Defines your application's IP address in the IP range, used for the service and to deploy the application.

How work

That is correct.

4. You are designing a GKE solution. One of your requirements is that network traffic load balancing should be achieved for Pods that are distributed across the cluster. How can you ensure this for your environment?

1/1 points

- ☐ Configure an Ingress controller to route traffic to the Pods in the cluster.
- ☐ Configure an Ingress controller to route traffic to the Pods in the cluster.
- ☐ Configure an Ingress controller to route traffic to the Pods in the cluster.
- ☐ Configure an Ingress controller to route traffic to the Pods in the cluster.
- ☐ Configure an Ingress controller to route traffic to the Pods in the cluster.

How work

This is the correct answer. In a Pod, the IP address is assigned to the Pod's network interface. If the Pod's IP address is exhausted, the Pod gets assigned a new IP address.

5. You need to apply a network policy to the Pods in the cluster to restrict traffic to the Pods. How can you ensure this for your environment?

1/1 points

- ☐ You have not enabled network policies in the cluster. Enable network policies and create all of the rules.
- ☐ Network policies are only applied when a Pod is created. Stop and restart all of the Pods in your application to ensure the network policy.
- ☐ A network policy must be applied to all Pods in the cluster to restrict ingress traffic. In the network policy, specify the Pods in the cluster to restrict ingress traffic.
- ☐ You need to create a Pod's IP address for the network policy in the Cloud Console or Cloud SDK. Create a Pod's IP address for the network policy.

How work

That is correct.
