

Your grade: 75%

You scored 75% - You earned 75% - To pass you need at least 75% (between your highest score)

Submit

1. You are considering deploying a solution to using containers on Google Cloud. What Google Cloud solution provides a managed framework for deploying and running containerized applications?
- ☐ Google Kubernetes Engine
- ☐ Cloud Run
- ☐ Container Engine
- ☐ Kubernetes
- ☒ None work
- ☐ That is correct.
2. What Identity and Access Management (IAM) hierarchy structure is best for building an application in Google Cloud?
- ☐ Create a new folder under your organization root, then create projects inside that folder for the resources.
- ☐ Create a new organization root for the project, then create all projects and resources inside the new organization root.
- ☐ Create new projects and resources inside departmental folders for the resource model, organized by the company's applications.
- ☐ Create new projects for each of the company's applications, then create folders inside those for the resources.
- ☒ Try again
- ☐ Remove the folder on Resource Management.
3. You are developing a new product for a customer and need to be mindful of cost and resources. What Google Cloud tool can be used to monitor costs and resources within a project?
- ☐ Configure quotas and limits for each project folder.
- ☐ Configure the billing account at the project folder level in the resource hierarchy.
- ☐ Configure the billing account to track and report on costs at the project level.
- ☐ Set up budgets and alerts at the project level.
- ☒ None work
- ☐ That is correct.
4. One of the main benefits of cloud computing is that resources are elastic. What does that mean?
- ☐ When customers need more resources, they can get more. When they need less, they can scale back.
- ☐ You can quickly get more resources when you need them.
- ☐ You share resources from a large pool that enables automatic scaling.
- ☐ Resources can be allocated automatically.
- ☒ None work
- ☐ That is correct.
