elements, is highly automated and performance-driven:

- **Machine Learning Optimization:** Google uses a machine-learning-driven model to select the optimal combination of assets (including images, which feature color) for each ad slot. This model's predictions are built from the ad's performance history ²⁰ ²¹.
- **Performance Comparison:** Actual ad results are continuously compared against predictions, and the model updates itself based on this data for future ad auctions ²¹. This is an ongoing, real-time "test" of which visual elements, including color, perform best in a given context.
- **Asset Reports:** Advertisers are advised to review asset reports every two weeks or monthly. These reports measure assets by conversions, conversion rate, and cost-per-acquisition (CPA). Assets labeled "Low" should be replaced, and new assets can be inspired by "High" performing ones ²² ^{...}. This provides data-driven feedback on the effectiveness of visual choices.
- **Creative Testing:** Responsive Display Ads are specifically highlighted as "ideal for testing creative," as they can iterate thousands of asset permutations to find what works best ²⁵.
- **Impact of Custom Colors:** While advertisers can specify custom primary and secondary brand colors, Google notes that choosing to run ads only in layouts that respect these custom colors can lead to a loss of up to 75% in conversions and reach ²⁶ ²⁷. This demonstrates how custom color cho  against broad performance metrics.

Notebooks V1 is now Gemini Notebook. You can still follow the video and complete the lab.

If the Gemini Notebook app fails to load, navigate to the URL bar in your browser and manually enter <https://gemini.google.com>.

Build with AI: Research summaries

To use the features covered in this lab, sign into Gemini Notebook using your Google Account.

As you follow the video instructions in this lab, customize the prompts below to fit your own work.

Feel free to pause the video as needed.

Lab tasks:

Step 1: Generate a summary of your sources

After you sign into Gemini Notebook, select "Create a new notebook".

You'll then be presented with a pop-up menu where you can upload documents. If you don't have any sources, you can use these sample materials: [audio](#), [text](#), [website](#), and [youtube video](#). Once your sources are loaded, paste the prompt below into the prompt text box.**Summarize the key learnings from these sources in [desired length, e.g. one page].**

Review Gemini Notebook's summary. Note that the summary includes citations, as Gemini Notebook draws directly from the sources you provided. This reduces hallucinations, and it allows you to check the output for accuracy and use AI responsibly.

Step 2: Ask questions about your sources

In the same notebook, ask questions about your sources by typing them into the text box at the bottom of the page. You can find themes across your materials, dig deeper into a single file, or see which documents address a specific topic.

If you've used the sample material, try this question:

In any of these sources talk about how to best different color choices in design?

Step 3: Generate additional resources from your sources

In the same notebook, use the right-hand Studio panel to generate additional resources. You can generate an **Audio Overview**, **Video Overview**, **Mind Map**, and more by clicking on the corresponding buttons in the Studio panel.

Next steps:

Gemini Notebook offers many ways for you to summarize your collection of files. Try uploading files that are relevant to your work to better understand their contents. Remember to be responsible when selecting which documents to upload.

When you are satisfied with your outputs from this lab, you can close this page and return to the main screen of this unit.
