1. You have a pipeline that reads data from a source and writes it to a destination. The source data is in a CSV file and the destination is a BigQuery table. The pipeline is currently configured to read the data from the source and write it to the destination. However, the source data has changed and now includes a new column. What should you do to update the pipeline?

☐ A. You should update the pipeline to read the data from the source and write it to the destination.

☐ B. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☐ C. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☐ D. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☒ E. None of the above.

2. You have a pipeline that reads data from a source and writes it to a destination. The source data is in a CSV file and the destination is a BigQuery table. The pipeline is currently configured to read the data from the source and write it to the destination. However, the source data has changed and now includes a new column. What should you do to update the pipeline?

☐ A. You should update the pipeline to read the data from the source and write it to the destination.

☐ B. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☐ C. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☐ D. You should update the pipeline to read the data from the source and write it to the destination, but you should also update the pipeline to read the data from the source and write it to the destination.

☒ E. None of the above.
