Final Project: Elicit Requirements and Manage Stakeholders with AI Assistance

Estimated time: 60 minutes

Introduction

Welcome to the final lab of this course, which also serves as your final project. In this session, you'll apply the tools, frameworks, and Generative AI (GenAI) techniques you've developed throughout the program.

You'll work on a business case for **Shop Ease Online**, a growing e-commerce company exploring AI solutions for customer support. Using this scenario, you'll leverage GenAI tools such as **ChatGPT**, **Gemini**, **Claude.ai**, or **Copilot** to perform three key program and stakeholder management actions:

1. **Gather and organize requirements** based on a business case.
2. **Develop a RACI chart** identifying roles and responsibilities.
3. **Map stakeholder engagement strategies** aligned to power and interest.

Business Case Scenario: Shop Ease Online AI Chatbot

Background

Shop Ease Online is a growing e-commerce retailer specializing in consumer electronics. Customer inquiries have surged, but support still relies on live agents and email responses. Delays, inconsistent service, and high costs have prompted the company to explore automation.

The Proposed Solution

Shop Ease Online proposes to implement an AI-powered chatbot that can provide instant 24/7 assistance, answer routine questions, offer order tracking, and hand off complex cases to human agents. The chatbot will integrate with Shop Ease Online's CRM and order systems and support multiple languages.

Expected Benefits
