

Shop Ease AI Chatbot: Business Case Review

Category	Entry
Key Goals	Implement an AI-driven chatbot to reduce manual customer support tickets by 40% within the first six months.
Challenges	High volume of repetitive inquiries causing long wait times; potential customer frustration with automated responses.
Assumptions	The existing Customer Service team will be available for training the AI; internal data is sufficient to build a robust knowledge base.
Data Gaps	Current breakdown of "common questions" vs "complex issues" is not quantified; missing historical peak-hour traffic data.
Clarification Questions	Will the chatbot have authority to process refunds, or is it strictly for information? What is the specific budget for third-party AI API usage?
