

Here are the correct answers and explanations for your Course Challenge assessment:

Question 1

Answer: Frame the prompt around the troubleshooting task and use generic placeholders like "[Customer Name]" instead of the actual personal details.

Explanation: The ACT (Apply, Check, Tell) framework for responsible AI emphasizes data privacy and protection (**Apply**). You should never feed Personally Identifiable Information (PII) like names or home addresses into public AI models. Anonymizing the data with placeholders gives the model the necessary context without compromising customer privacy.

Question 2

Answer: The underlying patterns it learned from analyzing massive amounts of training data

Explanation: Generative AI models function by recognizing statistical patterns, associations, and structures in their training data to predict and generate new, contextually relevant text.

Question 3

Answer: The application interface displays the results to you, while the underlying AI model uses machine learning to find patterns and make inferences on the data.

Explanation: In modern software, the front-end (application interface) handles user interaction and visual display, whereas the back-end AI model performs the pattern recognition, data processing, and inference.

Question 4

Answer: Apply your unique context about the engineering team's current goals to prompt Gemini to refocus its synthesis specifically on the onboarding flow feedback.

Explanation: Viewing "AI as a collaborator" means guiding the model using your specific human domain knowledge, context, and clear instructions rather than discarding its initial work or settling for generic results.

Question 5

Answer: Use the "Check" phase to independently verify the information by looking at the raw source text to identify where the error originated.

Explanation: Under the ACT framework, the Check phase requires human-in-the-loop verification (fact-checking AI outputs against reliable primary source

materials) to catch hallucinations or factual mistakes before using the content.

Question 6

Answer: Evaluate the output for bias, then iterate on the prompt to request that it highlight benefits for a wider audience of readers.

Explanation: Responsible AI practice requires evaluating output for hidden bias or narrow perspectives and refining (iterating on) your prompt to achieve inclusive, well-rounded content.

Question 7

Answer: Check the tone of the output and iterate on your prompt to include your company's editorial guidelines.

Explanation: Providing explicit constraints—such as brand voice guidelines or style rules—is the most reliable way to steer an AI tool toward the correct tone and align with company standards.

Question 8

Answer: Edit your initial prompt in the same chat to request Gemini use a grateful tone and include context about the impact of past donations.

Explanation: A core rule of effective prompting is specifying **Tone** and **Context**. Refining your prompt directly in the same chat allows the AI to adjust its draft based on explicit feedback without needing sensitive donor PII or complex persona swaps.

Question 9

Answer: In the same chat, first prompt Gemini for text options to establish the tone, then use a second prompt to generate the image by explicitly combining your chosen text and visual concept.

Explanation: Prompt chaining inside the same conversation thread builds a shared context loop. Generating text first establishes the overarching theme, which you can then pass into your visual prompt to keep the image and text aligned.

Question 10

Answer: Use Gemini's ability to research information and link back to its sources to find current and relevant statistics.

Explanation: Utilizing live search capabilities with source verification/citation features allows Gemini to rapidly extract up-to-date statistical data while giving you direct links to double-check accuracy.
