Create custom images with Gemini

To use the features created in this lab, sign into Gemini using your Google Account.

This lab will give you experience bringing an idea to life by generating images with Gemini. You can use image generation models to enhance your presentations, create or edit social media posts, or whenever you need custom visuals for your work.

The lab instructions below use a concert poster as an example, but you can adapt them to fit your own work.

Lab tasks:

Step 1: Brainstorm ideas for your image

First, we'll ask Gemini for some help generating and organizing ideas for our image.

You can use this process for any type of image you want, for example a social media post or a slide in a presentation.

**Tip:** Having trouble describing the style you want? Upload a reference image from your files or the web to show Gemini an example of what you're looking for.

When you are ready, click the "New chat" button to start a new chat with Gemini, and select the **Pro** model.

I need some ideas for a [type of image, e.g. concert poster, social media post, or presentation slide] about [what the image is about, e.g. a music band].

The style should be [visual style, e.g. modern, retro, or minimalist] and the mood should be [mood, e.g. excited, calm, or mysterious].

Please give me 3 different creative concepts. For each concept, provide a:

- 1. Description: A brief explanation of the visual layout.
- 2. Color Palette: A set of colors that fit the mood.

OPTIONAL:

**Reference image:** I have attached an image for you to use as a reference. Please look at this image and use its [composition / color scheme / overall style] to inform your suggestions.

You'll use the ideas generated here later in Step 3.

Step 2: Draft text for your image

In the same chat, you can ask Gemini for some ideas for any text that you might want to go with your image.

Paste the prompt below and replace the text in [brackets] with your own details.

Generate 3 options for text for a [type of project, e.g. poster, social media post, or presentation slide] about [the main subject or topic].

For context, [additional details or key information]. The tone of the writing should be [desired style, e.g. bold, professional, or playful] in order to [primary objective, e.g. get people to attend, explain a concept, or spark a conversation].

Please provide a few options ranging from short and punchy to more descriptive.

The text generated will also be used to give context that Gemini can use when generating images in the next steps.

Step 3: Generate the image by combining your ideas

Now, it's time to bring everything together to generate your final image. In the same chat, use the prompt below to combine your favorite visual concept and the text you just generated. This context will help Gemini more accurately create what you are looking for.

Based on the [chosen creative concept] and the text "[insert your favorite headline/text here]", generate a detailed image.

The image should feature [subject/main focus] in a [visual style, e.g. photographic, 3D render, or oil painting] style.

Ensure the composition includes [layout requirements, e.g. plenty of empty space at the top or a blurred background]. The overall mood should be [mood/style].

Step 4: Edit the image

Often there will be some adjustments you'll want to make to the image to get it to be exactly what you want. For example:

- Changing the Composition
  - This is great, but can you move the [subject, e.g. the guitar] to the [position, e.g. left side] to leave more room for my text on the [opposite side, e.g. right]?
- Adjusting the Lighting/Color
  - Can you make the overall lighting [mood, e.g. brighter and more natural] and change the background colors to [specific colors, e.g. shades of blue and silver]?
- Adding or Removing Detail
  - Please keep the same style, but add [detail, e.g. a subtle texture or more people in the background] and remove the [item to remove, e.g. the bright lens flare].
- Modifying the Style
  - I like the layout, but can you change the style from [current style, e.g. a photo] to a [new style, e.g. a minimalist vector illustration]?

You can repeat this step until you arrive at an image you like, adjusting the prompt to provide direct feedback each time.

Next steps:

The next time you need images, try using this process. Adjust the prompts and steps to what works best for you and gets you the outputs you need.
