Graded Assignment • 30 min

Due Mar 31, 11:59 PM IST

Your grade: 100%

Your latest: 100% • Your highest: 100% • To pass you need at least 80%. We keep your highest score.

Next Item

1. Which services can be used for data ingestion into your data lake? (Select TWO.) 1 / 1 point

- [x] Amazon Kinesis Data Firehose

Correct
To ingest data into your data lake, you can use real-time streaming data and bulk data assets from on-premises storage systems. You can also use data generated and processed by legacy on-premises systems, such as mainframes and data warehouses.

Amazon Kinesis Data Firehose is a fully managed service for delivering real-time streaming data directly to Amazon S3.

- [ ] Amazon QuickSight
- [ ] Amazon Athena
- [x] AWS Storage Gateway

Correct
You can use AWS Storage Gateway to integrate legacy on-premises data processing systems with a data lake in Amazon S3.

- [ ] Amazon Redshift

2. Which service uses continuous data replication with high availability to consolidate databases into a petabyte-scale data warehouse by streaming data to Amazon Redshift and Amazon S3? 1 / 1 point

- ( ) AWS Storage Gateway
- ( ) AWS Schema Conversion Tool (AWS SCT)
- (•) AWS Database Migration Service (AWS DMS)
- ( ) Amazon Kinesis Data Firehose

Correct
AWS DMS helps you migrate databases to AWS quickly and securely. The source database remains fully operational during the migration, minimizing downtime to applications that rely on the database. AWS DMS can migrate your data to and from most widely used commercial and open-source databases.

AWS DMS supports homogeneous migrations (such as Oracle to Oracle) and heterogeneous migrations between different database systems (such as Oracle or Microsoft SQL Server to Amazon Aurora). With AWS DMS, you can continuously replicate your data with high availability and consolidate databases into a petabyte-scale data warehouse by streaming data to Amazon Redshift and Amazon S3.

3. Which AWS Glue feature catalogs your data? 1 / 1 point

- (•) AWS Glue Crawler
- ( ) AWS Glue Dataflows
- ( ) AWS Glue Studio
- ( ) AWS Glue Streaming extract, transform, and load (ETL)

Correct
A Crawler accesses your data store, extracts metadata, and creates table definitions in the AWS Glue Data Catalog. The Crawlers pane in the AWS Glue console lists all the Crawlers that you create. The list displays status and metrics from the last run of your Crawler.

4. Your data resides in multiple data stores, including Amazon S3, Amazon RDS, and Amazon DynamoDB. You need to efficiently query the combined datasets.

Which tool can achieve this by using a single query without moving data? 1 / 1 point

- (•) Amazon Athena Federated Query
- ( ) Amazon Redshift Query Editor
- ( ) Structured Query Language (SQL) Notebook
- ( ) AWS Glue Dataflows

Correct
With Amazon Athena Federated Query, you can run structured query language (SQL) queries across a variety of relational, non-relational, and custom data sources. You get a unified way to run SQL queries across various data stores.
