|---|-----------------|
| <p>1. How effective is the use of a core BIM/digital design, business, or planning data flow map (or map)?</p> <ul style="list-style-type: none"> Generative AI can generate high-quality maps that serve as a visual structure. AI can automatically generate the process flows in the diagrams. AI can optimize the map to include the process flows, data, events, and resources. AI can generate plain text descriptions of process flows that clearly display planning tasks, events, decisions, and resources. | <p>1 (100%)</p> |
| <p>2. What information does the generated 4D/5D map provide unstructured information, such as meeting notes or issues, in structured modes?</p> <ul style="list-style-type: none"> Generative AI organizes multiple notes into a single block of text for review. Generative AI generates conversation notes that highlight points for easy review and reference for stakeholders. Generative AI detects or categorizes issues in structured meeting notes and emails that users provide. Generative AI converts plain text into flowcharts that clearly display process steps, decisions, and resources. | <p>1 (100%)</p> |
| <p>3. How does generative AI improve the accuracy of project architecture reviews?</p> <ul style="list-style-type: none"> AI creates diagrams that exclude data movement between resources. AI summarizes or on the user interface, and helps users find errors for developers and stakeholders to fix. AI generates project goals instead of mapping technical content. AI simplifies flow components and suggests alterations to strengthen performance. | <p>1 (100%)</p> |
| <p>4. How does generative AI evaluate system information and recommendations for efficiency and clarity?</p> <ul style="list-style-type: none"> Generative AI interprets unstructured content and reformats it into well-organized visual process diagrams. | <p>1 (100%)</p> |
| <p>5. Why is reviewing flow diagrams with generative AI valuable during workflow optimization?</p> <ul style="list-style-type: none"> Because it converts diagrams into readable project goals or objectives and forms an accessible summary of workflow objectives. Because it helps identify where flows decrease or become inefficient within the system. Because it provides data flow diagrams with additional information that assists in data handling processes. Because it reviews data flow diagrams and generative AI explains the reason for system testing. | <p>1 (100%)</p> |
| <p>6. How does generative AI evaluate data flow diagrams to identify bottlenecks and suggest methods to enhance the process?</p> <ul style="list-style-type: none"> Generative AI creates data flow diagrams that clearly, balances, and suggest methods to enhance the process. | <p>1 (100%)</p> |
| <p>7. How does generative AI help reduce errors and improve workflow after the planning process?</p> <ul style="list-style-type: none"> By generating meeting objectives into a single paragraph that clarifies notes for teams to review the task/working session. By analyzing unstructured meeting notes into organized diagrams that reveal steps and decision points. By mapping actual data and notes for follow-up to each team member automatically after a meeting. By listing all meeting notes in a database without requiring them. | <p>1 (100%)</p> |
| <p>8. How does generative AI structure information from their visual workflow, making it efficient and easy to identify.</p> <ul style="list-style-type: none"> Generative AI structures unstructured information into clear visual workflows, making it efficient and easy to identify. | <p>1 (100%)</p> |
| <p>9. What type of process document can be produced when generative AI analyzes workflow steps and feedback loops?</p> <ul style="list-style-type: none"> A detailed checklist that outlines each task, approval point, and responsible owner. A summary of current ongoing projects and their status. A summary of current history and future planning, with data and events. A project summary that lists high-level goals without needing details on process actions for teams or projects. | <p>1 (100%)</p> |
| <p>10. When does generative AI perform the most accurate and useful tasks during the organizational data?</p> <ul style="list-style-type: none"> When users decide business goals and how to allocate resources to achieve strategic objectives. When users create structured prompts that define data sources, key metrics, and visual formats. When users share detailed constraints of internal models and request visualizing overall performance. When users generate reports and how to describe the results to the main theme. | <p>1 (100%)</p> |
