

Your grade: 100%

From score: 100% / 1. Your response: 100% / 1. To pass you need at least 75%. We keep your highest score.

Submit

1. Your service has an availability SLA of 99.9%. What could you use to monitor whether you are meeting it?

1 / 1 point

- ☐ Latency probe
- ☐ Synthetic check
- ☐ Readiness probe
- ☐ Health check

☒ Network

This answer is correct. Availability is the percentage of time a system is running and able to process requests. Monitoring the network will enable the detection of the 99.9% metric.

2. You're deploying test environments using Google Engine VMs. Some downtime is acceptable, and it's very important to deploy them as infrequently as possible. When something below could save you the most money?

1 / 1 point

- ☐ Committed use discount
- ☐ Scheduled maintenance
- ☐ Preemptible machines
- ☐ Sustained-use discount

☒ Network

This answer is correct. There are two main cost-effective solutions as required in the question to 99.9% lower the expenditure for pre-emptible environments and the most cost-effective is acceptable price of that the expenditure can be used with pre-emptible machines.

3. You made a minor update to a service and need to test it in production by sending a small portion of requests to the new version. Which would you choose?

1 / 1 point

- ☐ Canary deployment
- ☐ Rolling update
- ☐ A/B testing
- ☐ Blue/green deployment

☒ Network

This answer is correct. Canary deployment allows to roll out the new version of the code to a small subset of users to test and a new feature and track the performance of the code.

4. You're making a fix to one of your services. The goal is to deploy the new version with no downtime. Which would you choose?

1 / 1 point

- ☐ Rollback
- ☐ Blue/green deployment
- ☐ Rolling update
- ☐ Canary deployment

☒ Network

This answer is correct. Rolling update will update instances incrementally and all have been updated. The rolling update is possible for example by using a managed instance group and a Compute Engine or with GKE.
