Your latest: 100% • Your highest: 100% • To pass you need at least 80%. We keep your highest score.

Reveal Answer

1. Which of the following are the core components of the Model Context Protocol (MCP)?

1 / 1 point

- ☐ Host, API Gateway, LLM
- ☐ Client, Database, LLM
- ☒ Host, Client, Server
- ☐ API Gateway, Database, Server

Nice work

The main MCP components are the host, client, and server.

2. Which of the following is a key benefit of using the Model Context Protocol (MCP)?

1 / 1 point

- ☐ Makes AI models independent of external data sources
- ☒ Enables standardized integration, interoperability, and enhanced agentic workflows
- ☐ Requires custom integrations for each AI application
- ☐ Reduces the need for agentic workflows

Nice work

MCP provides a common protocol for connecting AI applications, supports cross-platform development, and facilitates multi-agent collaboration.

3. What role does the Context? MCP server play when integrated with clients such as Cursor or Windsurf?

1 / 1 point

- ☐ It stores local project files and manages version control for MCP clients
- ☒ It provides up-to-date documentation and code snippets that MCP clients can retrieve through standardized tools
- ☐ It converts user prompts into executable code without external references
- ☐ It generates responses directly without involving a large language model

Nice work

Context? acts as an MCP server that exposes tools for resolving libraries and retrieving relevant documentation in a structured format.

4. What is the key difference between using a remote MCP server connection and a local MCP server connection in the MCP application demonstration?

1 / 1 point

- ☐ Local connections require an API key, whereas remote connections do not
- ☐ Remote connections are limited to read-only operations, whereas local connections allow tool execution
- ☐ Remote connections support fewer MCP tools than local connections
- ☒ Remote connections access the MCP server over HTTP, whereas local connections run the server using standard input and output

Nice work

The demonstration shows remote MCP servers accessed via HTTP and local servers accessed through standard input/output.

5. Which statement best describes how MCP differs from traditional APIs when used in AI agent integrations?

1 / 1 point

- ☒ MCP provides a standardized, AI-focused protocol that enables dynamic discovery of tools and context across servers
- ☐ MCP is a general-purpose integration approach designed for any type of software system
- ☐ MCP requires developers to manually update clients whenever server capabilities change
- ☐ MCP replaces APIs by eliminating the need for client-server communication

Nice work

MCP is designed specifically for AI agents, offering standardized interfaces and runtime discovery of capabilities.
