Reveal Answer

1. What is the main role of the transport in an MCP server setup?

1 / 1 point

- ☐ It defines the type for tools and returns values for MCP tools.
- ☐ It stores resources and prompts for agent use.
- ☒ It enables communication between the MCP client and the MCP server.
- ☐ It converts MCP tools into LangChain-compatible tools.

Nice work

The transport allows the client and server to exchange messages and results across STDIO, HTTP, or in-memory connections.

2. How are resources used in an MCP server?

2 / 2 point

- ☐ They convert MCP tools into a format compatible with LangChain.
- ☐ They provide templates for repetitive instructions that the agent can call.
- ☐ They are only functional when using HTTP transport.
- ☒ They act like filing cabinets that the agent can access to retrieve data.

Nice work

Resources allow the agent to access structured data using URI patterns and parameters.

3. Which statement accurately describes MultiServerMCPClient?

3 / 3 point

- ☐ It only supports MCP servers running over HTTP.
- ☐ It imposes a hard limit on the number of MCP servers that can be connected.
- ☒ It can connect to multiple MCP servers simultaneously while managing transport configurations.
- ☐ It eliminates the need for an MCP client or agent.

Nice work

MultiServerMCPClient allows connections to multiple servers and handles low-level transport details for the application.

4. What is the role of the @mcp.tool decorator in a FastMCP server?

4 / 4 point

- ☐ It initializes the FastMCP server object with a name and instructions.
- ☒ It registers a Python function as a callable tool that an agent can invoke.
- ☐ It creates reusable prompt templates for repeated instructions.
- ☐ It exposes data resources with URI patterns for the agent.

Nice work

The @mcp.tool decorator allows agents to call functions on the MCP server as active capabilities.

5. Which components are included when creating a complete Calculator MCPServer?

5 / 5 point

- ☐ Just a FastMCP object without any registered tools.
- ☒ Mathematical tools, document-loading resources, and prompt templates.
- ☐ Only Python functions registered with @tool.
- ☐ Only prompt templates for code review tasks.

Nice work

A full MCP server combines callable tools, reusable prompts, and accessible resources for agents.
