Knowledge check: AI customization and optimization

Practice Assignment • 15 min

Due Aug 22, 11:59 PM IST

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

1. **A developer is building an AI application to summarize news articles but finds the outputs are inconsistent. They decide to create a structured process to improve the prompts. What is the essential first step the developer should take before testing different prompts? Select the best answer.** 1 / 1 point

   ● Establish evaluation criteria to measure summary quality.

   ○ Experiment with different model parameters like thinking level

   ○ Draft a set of diverse prompts to test various approaches.

   ○ Gather a representative dataset of articles for testing.

   Nice work

   Correct! Defining clear evaluation criteria allows you to consistently measure the performance of any changes you make to the prompt or model.

2. **A marketing team is using an AI model to generate creative slogans for a new product. The initial slogans are too predictable and boring. Which Thinking level should the team choose in AI Studio to encourage richer, more varied slogan ideas? Select the best answer.** 1 / 1 point

   ○ Thinking level doesn't affect creativity—only the model choice does.

   ● Set the Thinking level to High to allow deeper reasoning and more ideation.

   ○ Set the Thinking level to Ultra for maximum creativity.

   ○ Set the Thinking level to Low to keep outputs more consistent and direct.

   Nice work

   Correct! High Thinking can produce more thoughtful, creative variations by giving the model more room to explore and refine ideas.

3. **A company needs to build a customer service chatbot that must provide quick, concise answers to common questions. The budget for the project is a major consideration. Which Gemini model is the most suitable choice for this task, balancing speed and cost-effectiveness? Select the best answer.** 1 / 1 point

   ● The Flash model, because it is built for high-frequency tasks where low latency is a critical factor.

   ○ The Pro model, because its advanced capabilities ensure the highest accuracy for all customer interactions.

   ○ The Flash model, because it is best suited for generating long and creative conversational text.

   ○ The Pro model, because it provides more comprehensive and detailed responses to user queries.

   Nice work

   Correct! The Gemini Flash model is designed for high-volume, low-latency applications like chatbots, making it the most cost-effective and responsive choice for this scenario.

4. **A developer is creating a reusable prompt template to ensure all AI-generated product descriptions are consistent. The template needs to guide the model effectively. Which component of a structured prompt template tells the AI model to act as a "professional copywriter"? Select the best answer.** 1 / 1 point

   ○ The constraints element

   ○ The output format element

   ● The role element

   ○ The context element

   Nice work

   Correct! The role element explicitly defines the persona or character the AI should adopt, such as a professional copywriter.

5. **A developer wants to determine if adding a specific instruction to a prompt improves the output's accuracy. They have the original prompt and a new, modified version. What feature in AI Studio is specifically designed to help the developer directly compare the outputs of these two different prompt versions side-by-side? Select the best answer.** 1 / 1 point

   ● The comparison mode

   ○ The prompt library

   ○ The API key manager

   ○ The model parameter settings

   Nice work

   Correct! AI Studio's comparison features, often in a split-screen view, are built for A/B testing prompts or models to evaluate performance directly.
