

Customer-Centric Serverless Architecture Design

Role Play

Sarah Chen

Hi! Thanks for taking the time to meet with us. I'm really excited to explore how we can modernize our infrastructure.

Sarah Chen has left. The Role Play activity has ended.

Feedback session

You faced that challenge head-on! Here is a summary of my notes:

Areas for improvement:

Task 1: Requirements Discovery

Why this is an opportunity: The conversation started without a clear discovery phase to understand DataStream's current architecture, pain points, traffic patterns, and business requirements. This initial step is crucial for tailoring an effective solution.

Task 2: Service Recommendation & Justification

Why this is an opportunity: There was no recommendation of specific AWS services (API Gateway, Lambda, DynamoDB, SNS/SQS) or an explanation of why each service would fit DataStream's use case, especially regarding messaging architecture and decoupling strategies.

Task 3: Architecture Design Presentation

Why this is an opportunity: There was no presentation of a cohesive serverless architecture showing how services work together, including data flow, event processing patterns, and sophisticated decoupling strategies.

Task 4: Address Concerns & Objections

Why this is an opportunity: The interaction did not progress to a point where Sarah's potential questions about performance, cost implications, security, implementation complexity, and message reliability could be addressed.

Task 5: Solution Validation

Why this is an opportunity: The conversation did not reach the stage of confirming whether the proposed architecture meets all requirements and gaining client buy-in for the next steps.

Practice again
