1. **At TechVision Corp, data engineer Alex is exploring how Sora can be used to enhance video content creation. Which key aspect should Alex focus on to ensure the most accurate video generation using Sora?** (1 / 1 point)

- ○ Using a high-resolution monitor
- ○ Focusing on the length of the text prompt
- ○ Ensuring the video is under 2 minutes
- ◉ Crafting detailed and structured text prompts

✓ Nice work

Detailed and structured prompts are crucial for accurate video generation with Sora.

2. **Data engineer Chris at FutureMedia is tasked with generating a video using Sora. What essential elements should Chris include in the text prompt to achieve a high-quality video?** (1 / 1 point)

- ○ Video duration, frame rate, and resolution
- ◉ Scene context, visual details, and motion
- ○ Font style, background music, and text length
- ○ Color scheme, text alignment, and aspect ratio

✓ Nice work

Including scene context, visual details, and motion in the prompt is essential for high-quality video generation.

3. **At DataInsights Inc., engineer Taylor is working on an image captioning project using Meta's Llama 4. Which stage involves converting the image into a format suitable for the model?** (1 / 1 point)

- ○ Multimodal LLM processing
- ◉ Image validation and encoding
- ○ Data augmentation
- ○ Input processing

✓ Nice work

Image validation and encoding involve converting the image into a suitable format for the model.

4. **For a project at VisionaryTech, data engineer Morgan is evaluating the Llama 4 model. Which component is responsible for combining visual features and text embeddings into a unified representation?** (1 / 1 point)

- ○ Image validator
- ○ Visual encoder
- ◉ Multimodal fusion layer
- ○ Language generation component

✓ Nice work

The multimodal fusion layer combines visual features and text embeddings.

5. **At DataPioneers, data engineer Jordan is tasked with implementing an image captioning model using Meta's Llama 4. Which step involves preparing the images by encoding them for processing?** (1 / 1 point)

- ○ Initializing the LLaMA model parameters
- ○ Creating a message with user role
- ◉ Encoding images to bytes for LLM processing
- ○ Setting up API credentials

✓ Nice work

Encoding images to bytes is crucial for LLM processing.

6. **At MediaSense Corporation, technical lead Jordan troubleshoots their newly implemented image captioning system. The system frequently rejects certain images without generating captions. After investigation, Jordan wants to understand which stage of the process is likely causing these rejections. Which component of the image captioning pipeline is responsible for determining if an image can proceed to the caption generation phase?** (1 / 1 point)

- ○ The language generation component
- ○ The multimodal fusion layer
- ○ The text embedding process
- ◉ The image validation step during preprocessing

✓ Nice work

The validation step specifically verifies that processed images meet technical requirements, contain detectable features, and are suitable for the model before allowing them to proceed to encode and caption generation.

7. **During a workshop, researcher Dario wants to explain the basic pipeline of how a multimodal LLM generates a caption from an image.** (1 / 1 point)

Which three stages should he describe?

- ◉ Input processing, image validation and encoding, and multimodal LLM processing
- ○ Dataset labeling, caption selection, and reinforcement tuning
- ○ Image editing, tagging, and summarization
- ○ Caption tokenization, grammar checking, and embedding alignment

✓ Nice work

These stages represent the complete flow of converting an image and an optional prompt into a coherent caption.
