1. **At TechVision Inc., data engineer Sarah is exploring OpenAI's Sora to enhance their video content creation process. She wants to generate a video depicting a serene beach scene at sunset with gentle waves and a soft breeze. Which key elements should Sarah focus on in her text prompt to ensure Sora generates an accurate video?** 1 / 1 point

   - ○ Motion and character interactions
   - ○ Visual details and background music
   - ◉ Scene context, visual details, and motion
   - ○ Scene context and character dialogue

   ✓ Nice work

   Focusing on scene context, visual details, and motion will help Sora generate a more accurate video.

2. **Data engineer Alex at InnovateTech is tasked with evaluating the effectiveness of Meta's Llama4 for image captioning. After implementing the model, Alex needs to assess its performance. Which key evaluation metrics should Alex consider to ensure a comprehensive analysis?** 1 / 1 point

   - ○ Precision, recall, and F1 score
   - ○ Accuracy, specificity, and sensitivity
   - ◉ BLEU score, METEOR, and CIDEr
   - ○ MAE, RMSE, and R-squared

   ✓ Nice work

   BLEU score, METEOR, and CIDEr are standard metrics for evaluating image captioning models.

3. **At CreativeMedia Corp., data specialist Jamie uses text-to-video models to create promotional content. She wants to understand the current capabilities and complexities of these models. What should Jamie focus on to grasp the intricacies of generating video from text prompts?** 1 / 1 point

   - ○ Script writing and storyboard development
   - ○ The use of GANs and their training datasets
   - ○ The number of frames per second and resolution settings
   - ◉ Video data representation and the role of diffusion models

   ✓ Nice work

   Understanding video data representation and the role of diffusion models is crucial for grasping the complexities of text-to-video generation.

4. **At TechVision Solutions, data analyst Morgan is implementing an automated image captioning system for the company's content management platform. Morgan wants to understand the technical process behind how these systems generate accurate descriptions for images. What should Morgan prioritize studying to grasp the fundamental mechanisms of image captioning using multimodal LLMs?** 1 / 1 point

   - ○ The resolution requirements and file format compatibility of images
   - ○ User interface design for caption editing and refinement
   - ◉ The three-stage process: input processing, image validation, encoding, and multimodal LLM processing
   - ○ Natural language generation techniques and grammar rules

   ✓ Nice work

   Understanding this three-stage process is essential as it represents the complete workflow of how multimodal LLMs transform visual information into textual captions.

5. **At VisualTech Inc., data scientist Alex is developing an image captioning feature for the company's accessibility platform. Alex notices that the system sometimes generates poor-quality captions and wants to understand which component is most critical for ensuring high-quality outputs. Which aspect of the image captioning pipeline should Alex focus on improving first?** 1 / 1 point

   - ○ The Base64 encoding process for the images
   - ◉ The multimodal fusion layer that combines visual features and text embeddings
   - ○ The text prompt collection interface
   - ○ The initial image resizing during preprocessing

   ✓ Nice work

   The multimodal fusion layer is where visual data and textual context are integrated into a unified representation, forming the foundation for accurate and contextually appropriate caption generation.
